

Fairness polarisation (a fifth, cross-cell outcome). Under one reward rule, weakly connected communities can settle in *different* cells — one in legitimate consensus, another correct-but-illegitimate — purely because they hold different perceived benchmarks $\hat{M}$. Low permeability Γ and slow benchmark transmission ψ keep the benchmark gap open (benchmark-gap lemma), so grievance need not equalise even as actions converge: a society can agree on *what* to do while disagreeing on *whether the rule is fair*.
